Tacit

FOR B2B COMPANIES

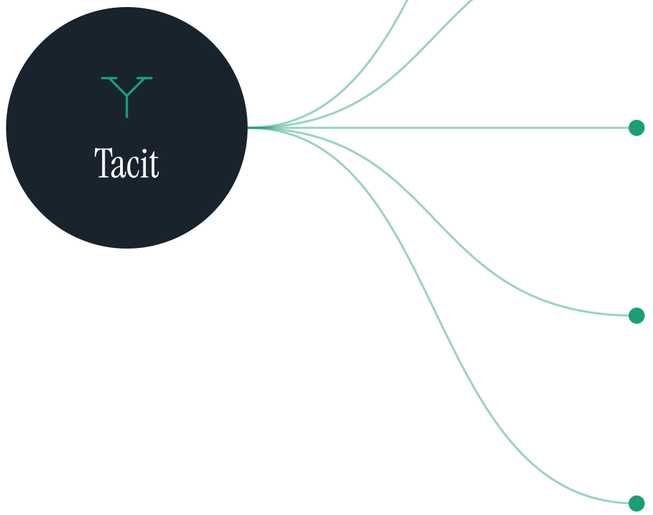

Human decisions as the engine of growth.

Profitability through an agentic strategy built on how people in the company already think and work.

Four services. One core.

With Tacit, your company will:

01

Reduce the risk of automating.

We diagnose first, then implement where 80% of the value is.

02

Keep its knowledge.

When someone leaves, what they knew stays. New people ramp up faster.

03

See its real inefficiencies.

Bottlenecks, errors and people dependencies, not the ones on the org chart.

04

Run agents that actually work.

They feed on Tacit's context, not text search.

05

Pay less per agent.

They get only the context they need, already processed.

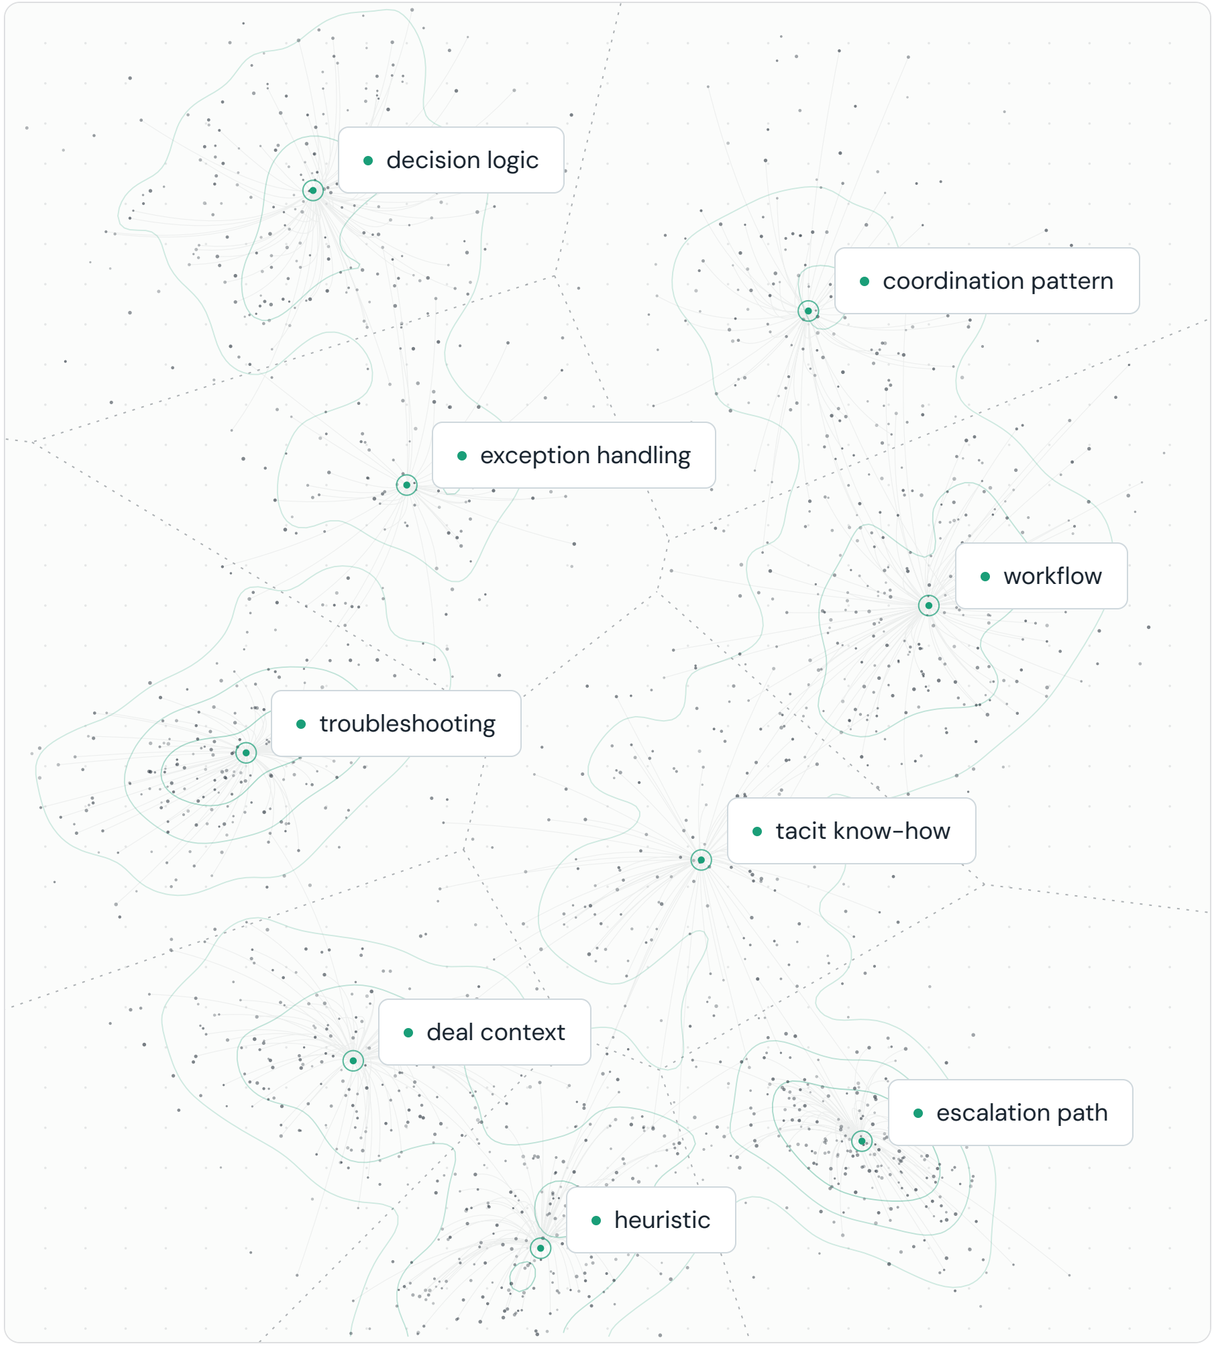

Companies can’t see where their work breaks.

Inefficiencies and bottlenecks live silently, unrecognized, and no system in the company shows them.

- Companies already bought the stack.

WHAT THE SPEND MISSES

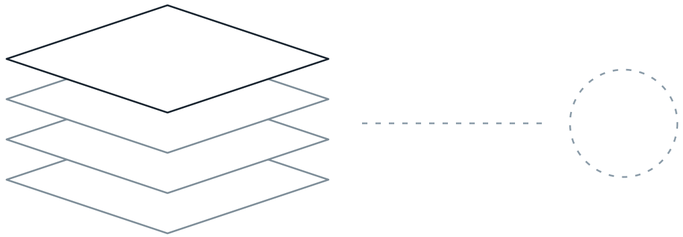

The failure is cultural: how people work, who they trust, which habits win under pressure. Another tool does not fix that. That gap is the market.

Companies are systems made by people.

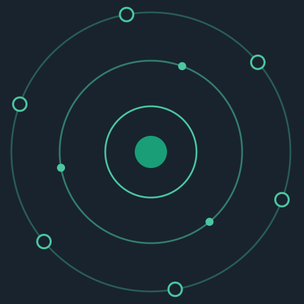

Agents improve them only when the human knowledge behind the system is understood.

THE USUAL BET

Capital goes to connecting context and dropping in agents, then hoping the culture follows.

OUR BET

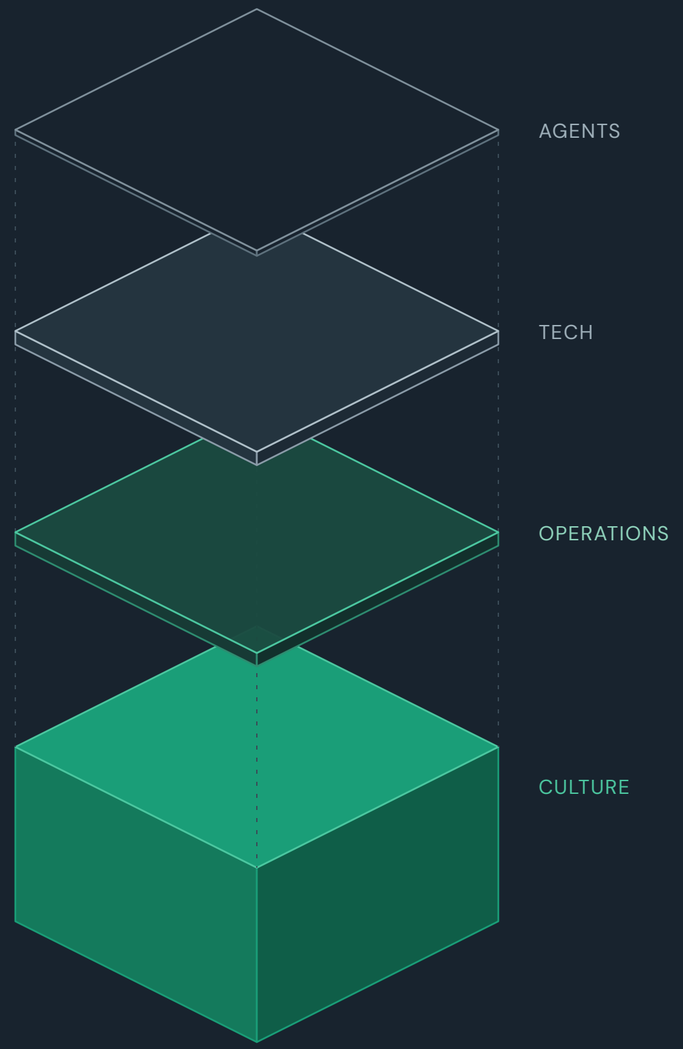

Capital goes to reading how work happens, restructuring, then agentizing from that culture.

Agentic success runs on judgment and culture.

Tacit makes both legible.

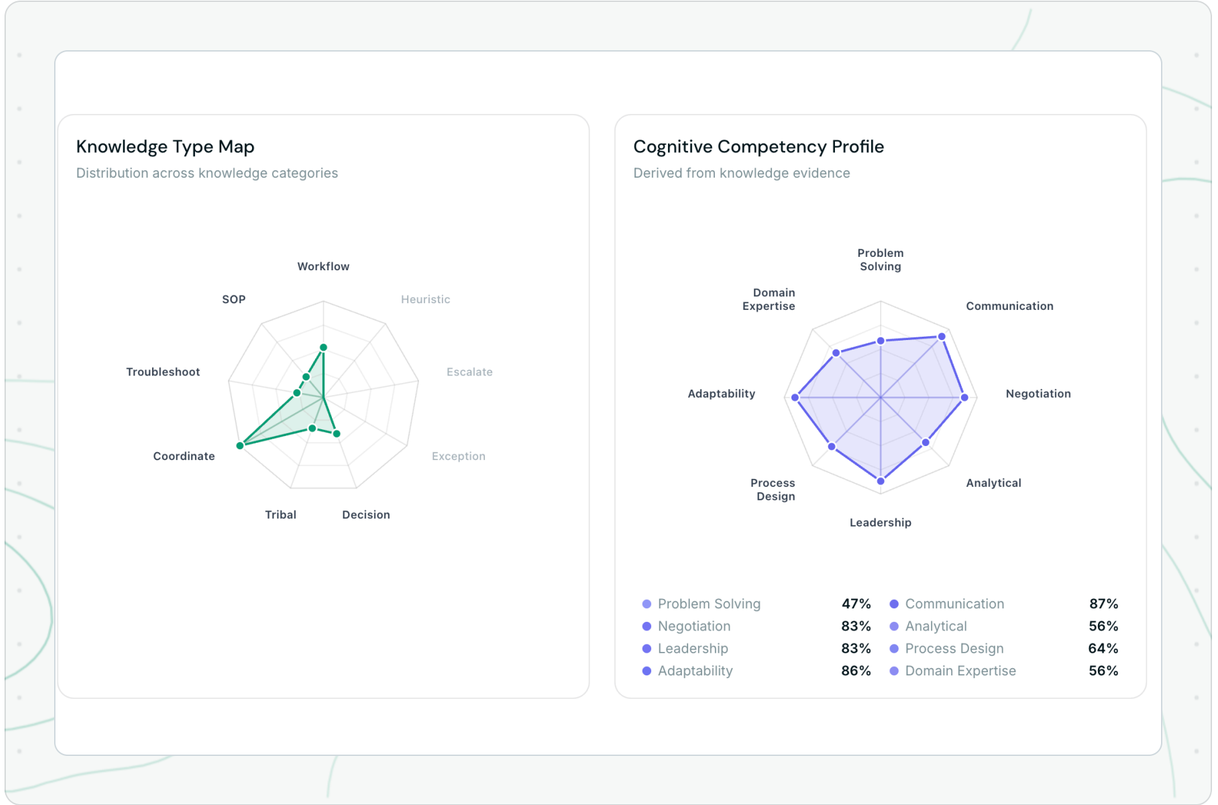

> Tacit captures the daily workflows and the tacit decisions behind them, and detects the inefficiencies where agents create the most value.

Tech is a layer, not the whole story.

A clear picture first. Agents later.

Tacit maps real communication, tools in use, and company knowledge. That picture lets you change how teams work. After that, we add a judgment layer so agents act like your best people, not empty chatbots.

Knowledge Type Map and Cognitive Competency Profile

Four services. One core.

Every service starts from how the work really happens.

01

Consulting layer

We see how your employees actually communicate and how they work day to day.

- Which tools they use, what they are biased toward, and where to find bottlenecks.
- That picture is extracted, so the next employee has no learning curve.
- An inefficiency is caught as it is created. We act then, before the client complains.

02

Implement agents

Agents are implemented from the real knowledge and the tacit workflows.

- The source is the real knowledge and the tacit workflows.
- An 80/20 thesis decides exactly where, how, and with whom.
- The aim is to raise the company's productivity and growth.

03

Agent in the loop

An agent stays in the loop as the company is agentified.

- The agent stays in the loop of the work.
- Agentification can cover one area.
- It can cover one process, or the operation as a whole.

04

Higher SLA

Clients are asking for a higher SLA. Today the client is a black box, and that blocks high efficiency.

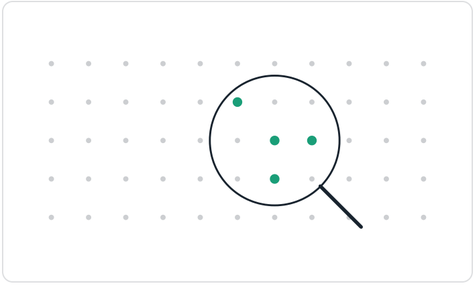

- Tacit is integrated to understand the client's behavior and knowledge.
- The solutions have one aim: a higher SLA, and growth in the client relationship.

Four steps. One sequence.

01

Diagnostic

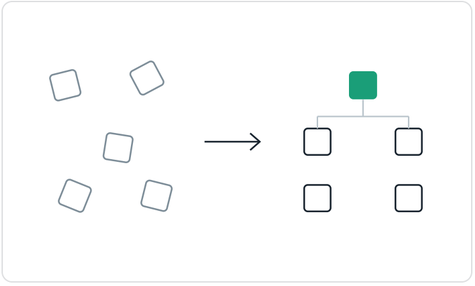

Map where expertise lives, how it is used, and which tools and steps are not productive.

02

Change premises

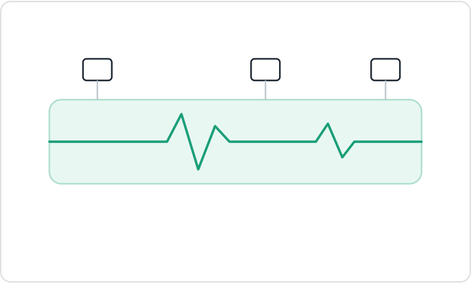

Change how the team works and trains: education, roles, and structure. Surface the inefficiencies and the bottlenecks.

03

Core basic agents

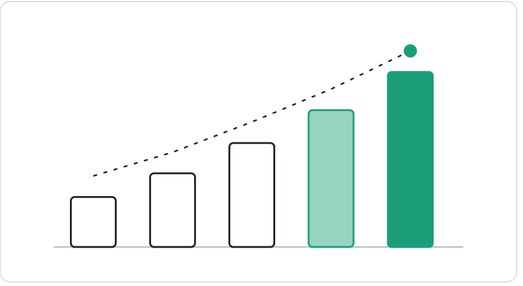

Implement Tacit and the tools people will actually use, so know-how becomes a living layer.

04

Agentification

Ship specific agents that show a visible gain, then extend them with the same people.

Four parts of the same work.

CONSULTING

AI transformation is contingent on human workflows.

Human workflows | A defined place | Measurable value

AGENTS

Simple, controllable agents at core points, then a human-agent symbiosis.

Simple and measurable | Core points | Quick results | Adoption

APPS

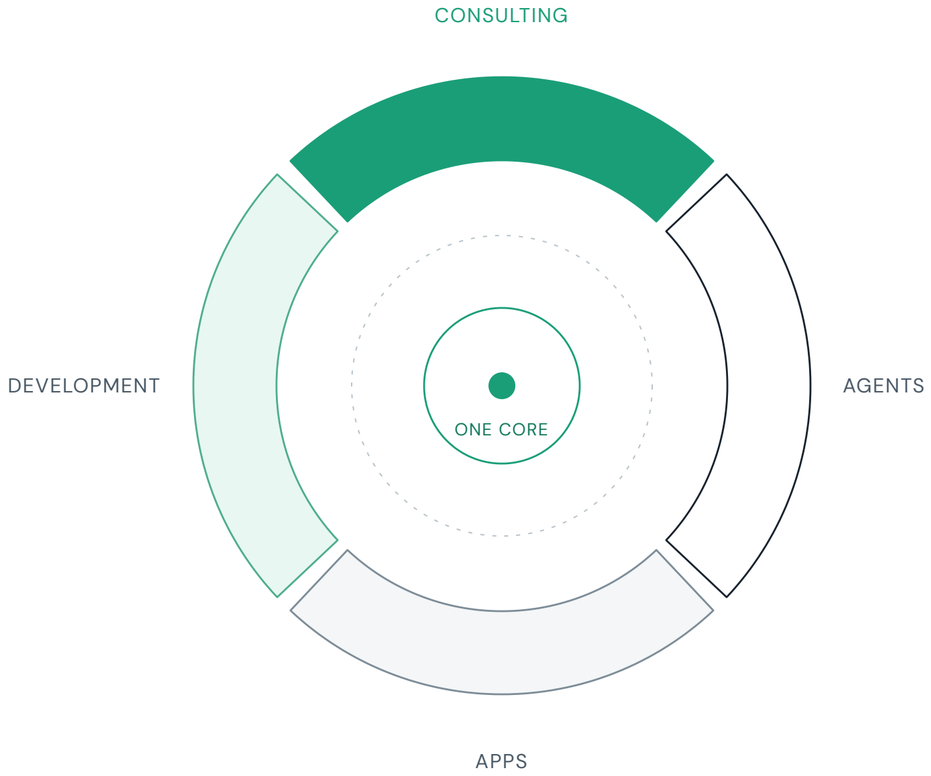

Systems to centralize, evaluate, and manage their own operation, empowered by Tacit.

Centralize | Evaluate | Manage | Empowered by Tacit

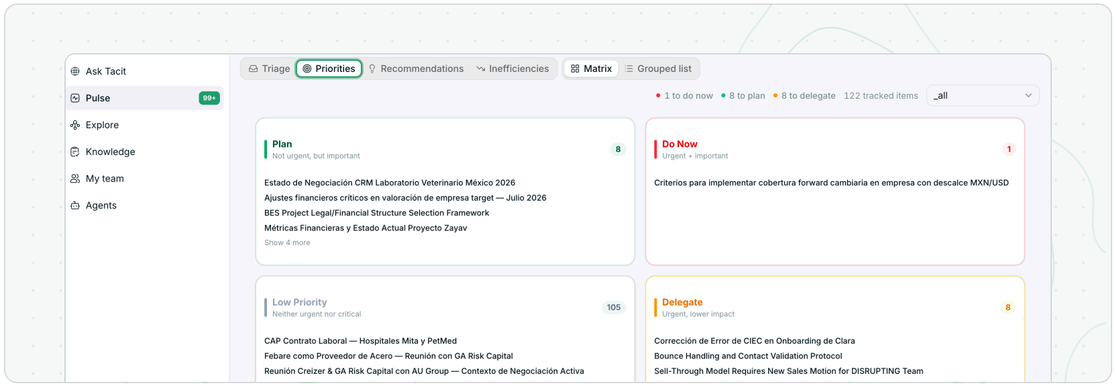

DEVELOPMENT

Intelligent infrastructure through the Tacit layer, for the client's core problems.

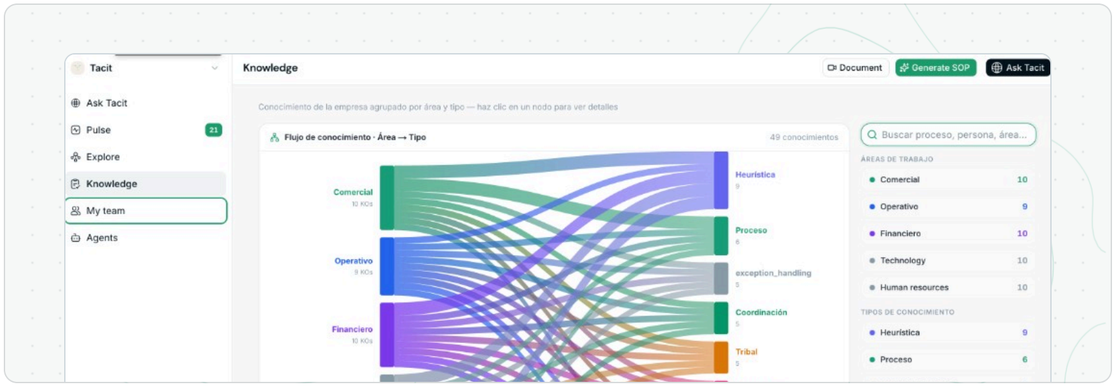

Core problems | Tacit layer | Intelligent infrastructure

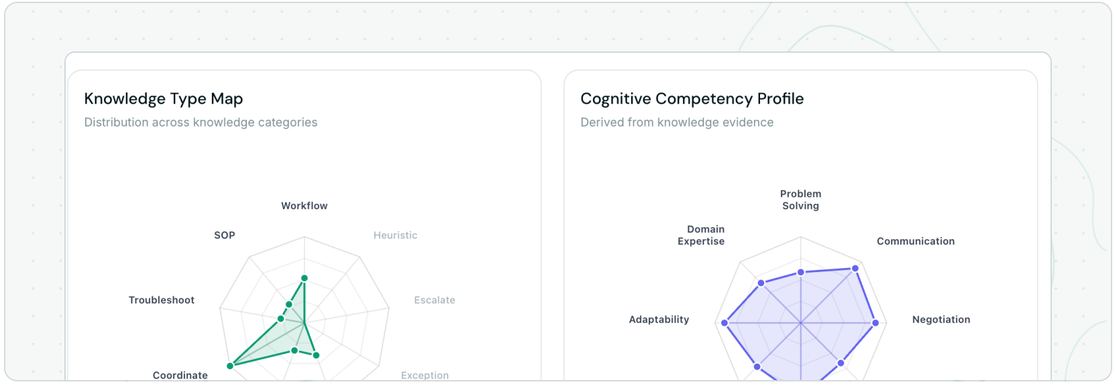

Four views. One product.

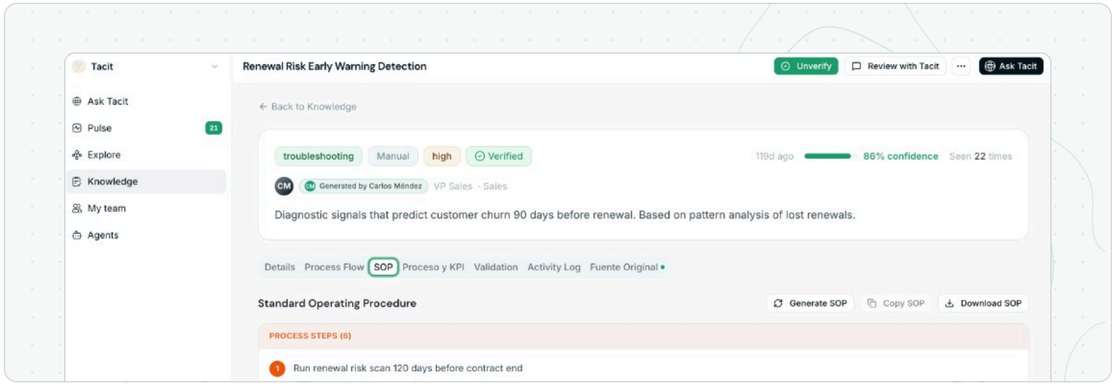

Pulse 01

Knowledge 02

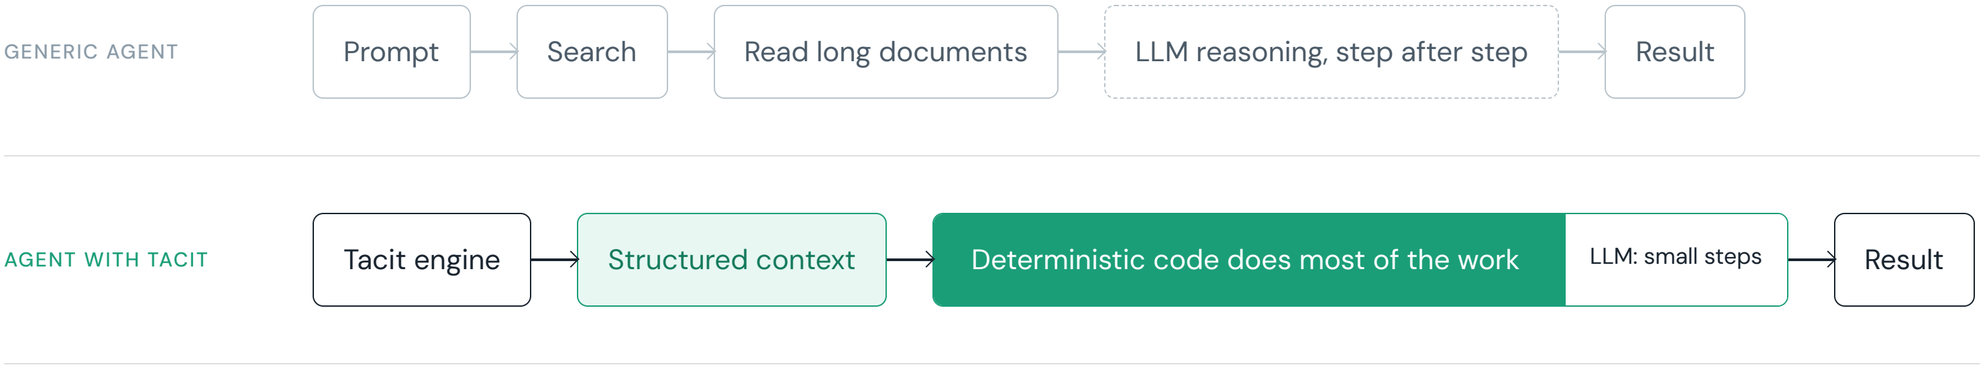

Profiles 03

A procedure 04

Simple, cost-effective agents.

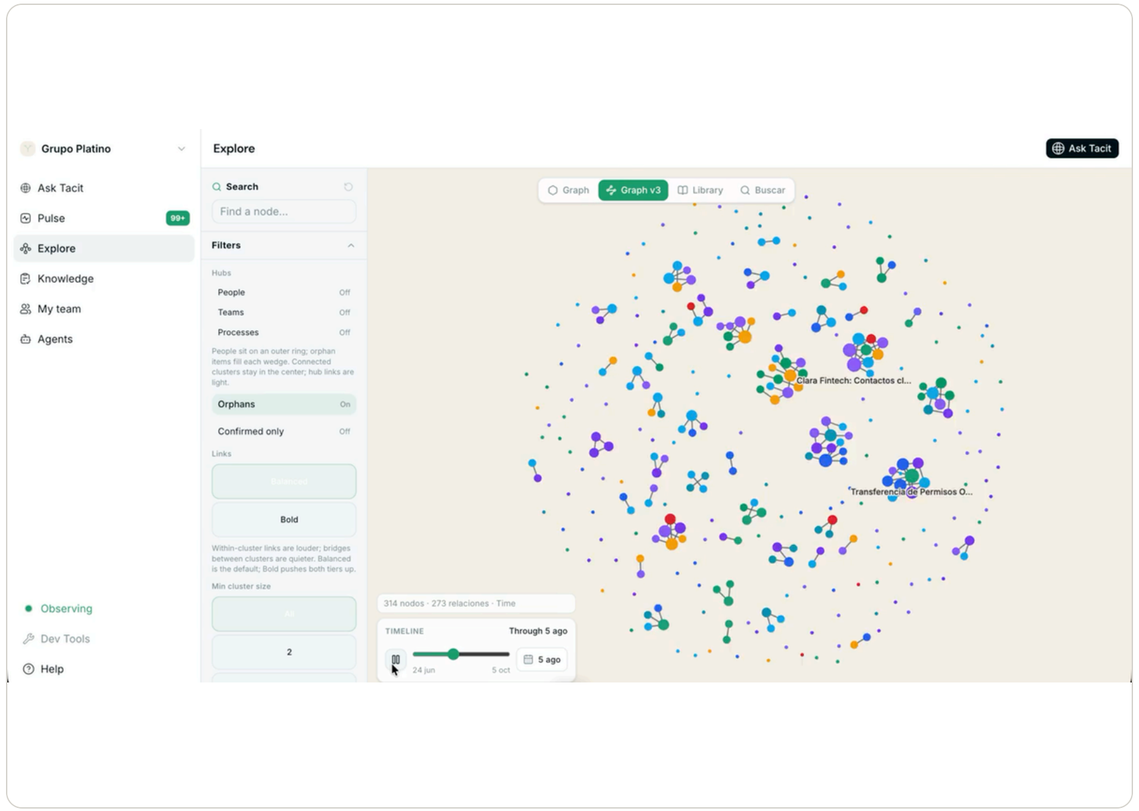

The agent receives the context already structured from Tacit and resolves most of the work with deterministic code. The language model only handles small steps.

- No heavy spend on language models
- No extra SaaS
- No reading of long contexts

An engine that understands organizations as they are.

An entrepreneurial and academic team, two engineers trained in neuroscience, artificial intelligence, and mathematics, is building an engine that joins complex systems, propositional logic, Bayesian theory, graph theory, LIWC, and modern theories of thought. It understands organizations as they are, and strengthens their digital transformation through agents.

Explore: the company as a knowledge graph

Usual path vs. Tacit.

USUAL PATH	WITH TACIT
Buy tools or agents first	• Start with the consulting layer
Trust the org chart	• See how people actually work, and which tools they use
Agents everywhere	• 80/20: exactly where, how, and with whom
The client stays a black box	• Understand them, then raise the SLA

Industries where we are running pilots.

Complex operations that inherently have high turnover, depend entirely on a few highly experienced managers, or keep a delicate relationship with clients who need a higher level of service.

Client efficiency is the goal. Yours improves with it.

Tacit

Start with how your team thinks and what they know, then turn that real experience into profitable growth.

Book a diagnostic. We start from the core, then deliver the service: consulting layer, agents, an agent in the loop, or a higher SLA.
